

IT Service Desk: Triage & Routing Policy

Orange Caterpillar Pvt Ltd · IT Operations · reference document

Your task

Twenty-five IT tickets have just come in. Read each one, work out its category and how bad the impact is, then set a priority, route it to the right team, and attach the response target. Order the queue so the worst problems are handled first. Nothing is ever auto-resolved.

How priority is set

Priority comes from impact and urgency:

- P1 Critical: a company-wide outage, a security report, a whole team unable to work, or a VIP fully blocked.
- P2 High: a team affected but with a workaround, a single user fully blocked, or a VIP affected.
- P3 Medium: a single user with a workaround or minor impact.
- P4 Low: routine service requests, such as new equipment, a software install, an access request, or a how-to.

One hard rule: any ticket that reports phishing, malware, or a suspected breach is treated as P1 and routed to Security Operations, whatever else it says. Nothing is auto-resolved or auto-actioned, the agent drafts and a human acts.

Routing table

Each line below maps a category to a team.

ROUTE: Access | Identity & Access

ROUTE: Email | Messaging

ROUTE: Hardware | Desktop Support

ROUTE: Network | Network Operations

ROUTE: Software | Application Support

ROUTE: Security | Security Operations

ROUTE: Telephony | Unified Comms

Response targets (SLA)

Each line below maps a priority to its response target.

SLA: P1 | Respond within 15 minutes

SLA: P2 | Respond within 1 hour

SLA: P3 | Respond within 4 hours

SLA: P4 | Respond within 1 business day
