

Backend Engineer — Python & APIs

NimbusPay · Bengaluru (hybrid) · Full-time

About the role

NimbusPay is a fast-growing payments company. We are hiring a backend engineer to build and run the services that move money reliably: APIs, data pipelines, and the systems behind them. You will own features end to end, from design to production, and keep them fast and correct at scale.

What you will do

- Design, build, and operate backend services in Python.
- Ship and maintain REST APIs used by web and mobile clients.
- Model and query data in a relational database (PostgreSQL or MySQL).
- Deploy and run services on a cloud platform, and help keep them healthy.
- Work with a small team, review code, and take real ownership of outcomes.

Must-haves (hard requirements)

- At least 3 years building backend services in Python, in a professional setting.
- Hands-on experience with REST APIs and a relational database.
- Experience deploying to a cloud platform (AWS, GCP, or Azure).

Nice-to-haves

- Docker or Kubernetes.
- Event streaming (Kafka or similar).
- Fintech or payments domain experience.
- A track record of staying and growing in a role.

How we shortlist

We compare every candidate against the same four things, and weight them. Use these to rank fairly:

Criterion	What we look for	Weight
Python depth	Real, hands-on backend Python, not just a course or a mention	35%
Production impact	Owned features in production, with evidence of real results	30%
Data & APIs	REST APIs plus a relational database, used for real	20%
Stability	Stayed and grew in roles, rather than very short stints	15%

One hard rule: a candidate must have at least 3 years of professional Python experience AND cloud experience. Anyone who fails this is flagged for a human to look at, never silently dropped.
